Insights

Graph1 – Memory vs Problem Size (M+N)

Nature of the Graph (Logarithmic/ Linear/ Polynomial/ Exponential)

Basic: Polynomial

Efficient: Linear

Explanation: The basic algorithm shows quadratic memory growth due to its $O(m \times n)$ space complexity, while the memory-efficient algorithm maintains linear growth with $O(\min(m, n))$ space usage.

Graph2 – Time vs Problem Size (M+N)

Nature of the Graph (Logarithmic/ Linear/ Polynomial/ Exponential)

Basic: Polynomial

Efficient: Polynomial

Explanation:

Both algorithms exhibit quadratic time complexity $O(m \times n)$, though the memory-efficient algorithm shows slightly higher execution times due to recursive overhead from the divide-and-conquer approach.

Contribution

Project

Note: To run python (3) files and write into output files, I have made use of the following command lines. (When I use "python3" in my command line, I encounter an error and hence used just "python" to run the files. Thank you.

```
chmod +x basic.sh
```

```
chmod +x efficient.sh
```

```
./basic.sh datapoints/in1.txt outputs/result1.txt
```

```
./efficient.sh datapoints/in1.txt outputs/result1.txt
```

```
./basic.sh test_cases/input1.txt outputs/test1.txt
```

```
./efficient.sh test_cases/input1.txt outputs/test1.txt
```
